---

Patient becomes unconscious

Object dislodged
CHOKING INFANT (0-1 YRS) INSTRUCTIONS

Is the baby awake?
- No
- Yes

See infant CPR instructions

Is the baby able to cry or cough?
- No
- Yes

Listen carefully. I'll tell you what to do.
Remove any clothing from the baby's chest, and then pick up the baby.
Do that, and come back to the telephone.
I'll stay on the line.

Turn the baby face down on your forearm; Support the baby's jaw in your hand
Lower your arm onto your thigh so that the baby's head is lower than its chest.
Use the heel of your other hand to strike the back 5 times firmly, right between the shoulder blades.
Do that, and come back to the telephone.

Does the baby cry or cough?
- No
- Yes

Roll the patient on their side and check their breathing until help arrives.
(If patient is in residence and able to do so) Turn on the porch light, and meet the help at the door. If you have a dog, please put it away. Gather all patient’s medication and/or list of medications. If the patient’s condition changes, call us back.

We're sending help

Place the baby in your forearm. Support the head and turn the baby onto its back.
Put your index and middle fingers directly between the baby’s nipples.
Push down ¼ - 1 inch. Do this 5 times and come back to the telephone

Baby becomes unconscious
Object dislodged.
Still conscious and choking, repeat sequence.

See infant CPR instructions

Is the baby crying or coughing now?
- No
- Yes

Roll the patient on their side and check their breathing
(If patient is in residence and able to do so) Turn on the porch light, and meet the help at the door. If you have a dog, please put it away. Gather all patient’s medication and/or list of medications. If the patient’s condition changes, call us back.

We're sending help

PRE-ARRIVAL INSTRUCTIONS

CHILDBIRTH INSTRUCTIONS

Ok, we're sending help. I have some simple instructions that I want you to follow that may assist him/her. Okay?

Ok/yes →

Listen carefully, I'll tell you what to do.

Has she had a baby before?

No/Yes

Does she have a strong desire to push?

Yes

No

No/won't/can't →

Okay, we're sending help.

Ok, we're sending help

Left side is best. Have her take Deep breaths.

Have the patient lie down on her left side.

Keep the patient warm.

If the patient uses the toilet, do not flush. Do not dispose of used pads.

	If patient is in residence and able to do so Turn on the porch light, and meet the help at the door.

If you have a dog, please put it away.

Gather all patient's medication and/or list of medications.

Rest or have the patient rest in the most comfortable position.

If the patient's condition changes, call us back.

We're sending help

If the baby head's appears first, cradle it and the rest of the baby as it is delivered.

Do not push or pull.

There will be water and blood with delivery. This is normal.

When the baby is delivered, clean out its' mouth and nose with a clean dry cloth.

Do not attempt to cut or pull the cord.

Wrap the baby in a dry blanket, a towel, or whatever is handy, and place it between the mother’s legs on the floor. Massage the mother’s lower abdomen very gently.

If the baby does not start breathing on its own, rub its' back or gently slap the soles of its' feet. If the baby does not begin to breathe immediately, come back to the telephone.

Complications with delivery

Baby delivered and breathing

Baby delivered and not breathing

When the placenta (tissue on the other end of the umbilical cord) is delivered, wrap it in a dry blanket or towel. This delivery may take as long as twenty minutes.

Keep the placenta level with or slightly above the baby.

I'll stay on the line

Go to infant CPR instructions

If there are any complications (leg, arm, buttocks, or umbilical cord presenting), reassure the mother. Tell her that we're sending help.

Ask her to relax and breathe through her mouth.

Tell her not to push.

I'll stay on the line
PRE-ARRIVAL INSTRUCTIONS

CHILD ALREADY DELIVERED INSTRUCTIONS

Ok, we’re sending help. I have some simple instructions that I want you to follow that may assist him/her Ok?

- Ok/yes
- No/won’t/can’t

Ok, we’re sending help

Complications with delivery  Baby delivered and breathing  Baby delivered and not breathing

Clean out the baby’s mouth and nose with a clean, dry cloth. Do not attempt to cut or pull the cord.

Wrap the baby in a dry blanket, a towel, or whatever is handy, and place it between the mother’s legs on the floor. Massage the mother’s lower abdomen very gently.

If the baby does not start breathing on its own, rub its back or gently slap the soles of its feet.

If the baby does not begin to breathe, immediately, come back to the phone.

Go to infant CPR instructions

When the placenta (tissue on the other end of the umbilical cord) is delivered, wrap it in a dry blanket or towel. This delivery may take as long as twenty minutes.

Keep the placenta level with or slightly above the baby.

If there is complications (leg, arm, buttocks, or umbilical cord presenting)

- Reassure the mother. Tell her you help is on the way.
- Ask her to relax and breathe through her mouth.
- Tell her not to push.
- I’ll stay on the line

Have the patient lie down on her left side.

Keep the patient warm.

Do not flush toilet or dispose of used pads.

(If patient is in residence and able to do so) Turn on the porch light, and meet the help at the door.

If you have a dog, please put it away.

Gather all patient’s medication and/or list of medications.

Rest or have the patient rest in the most comfortable position.

I’ll stay on the line
ASK: What do you need?

ANSWER: Paramedics/ambulance/other

ASK: What’s wrong with the person? See appropriate chief complaint

ANSWER: Med unit only

ASK: Where is the patient?

ANSWER: Medical Clinic, hospital, special event, or with County Fire Department on-duty personnel ———MEDMF

( Clarify to caller what type of response they’re getting)

ANSWER: Other ————See appropriate chief complaint

1. (Listen for IV running or infusing or medication given) ————ALSMF

2. (Listen for off-duty MFD or County FD members requesting Paramedics) ————ALSMF

PRE-ARRIVAL INSTRUCTIONS

Medical Facility, Doctor, Nurse, EMT, Or Physician Assistant Requests Emergency Medical Assistance

**MEDICAL FACILITY**

Prepare patient’s medical records for possible transport.

C.P.R. INSTRUCTIONS (Infant less than 1 year old)

Is the scene safe?
- Yes: Remain in a safe place. We’re sending help.
- No: Is anyone there willing to do CPR?

Is anyone there willing to do CPR?
- Yes: (If patient is in residence and able to do so) Turn on the porch light, and meet the help at the door. If you have a dog, please put it away. Gather all patient’s medication and/or list of medications. Have the patient rest in the most comfortable position. Patient may be more comfortable sitting up. If the patient’s condition changes, call us back.
- No: We’re sending help.

Does anyone there know how to do Infant CPR?
- No: Bring the baby next to the telephone!
- Yes: Do you need help in remembering the procedure?

Do you need help in remembering the procedure?
- Yes: Begin CPR with 5 chest compressions and 1 breath now. I’ll stay on the line if you need me or until help arrives.
- No: Listen carefully. I’ll tell you what to do. Lay the baby flat on its back on a hard surface, such as the floor or a table. Tilt the head back slightly by lifting the chin. Tightly cover the baby’s mouth and nose with your mouth. Blow 2 small puffs of air slowly into the baby’s mouth. Make sure the baby’s chest gently rises with each puff. Then come back to the telephone. I’ll stay on the line.

Bring the baby next to the telephone!

Listen carefully. I’ll tell you what to do next. Remove everything from the child’s chest. Put your index and middle fingertips on the center of the chest, right between the nipples. Push down slightly ½ - to 1 inch. Do it 5 times rapidly: Count: 1, and 2, and 3, and 4, etc. Then, tilt the head back slightly by lifting the chin and give 1 small puff of air slowly. Make sure the baby’s chest gently rises with each puff. Then, rapidly pump the chest 5 more times, and then give 1 more slow puff. Keep doing this until help arrives and takes over. I’ll stay on the line.

Is the baby moving, coughing, or breathing normally now?
- No: I can’t/hysterical
- Yes: Roll the baby over on its side and monitor his/her breathing until help arrives. I’ll stay on the line.
Note: Appropriate to use A.E.D on patients 1 years old or older

Remove everything off the patient’s chest. Make sure the patient is not in water or in a puddle.
Place defibrillator next to the patient’s left side.
Open cover and/or turn on defibrillator.
Open the pad package and place pads on the patient as pictured on the pads.
Make sure the pad cords are attached to the machine.

Follow the machine’s voice prompt next.
Wait for machine to analyze (push analyze button if present).
Do not touch the patient.
If the machine says “Shock patient”, make sure nobody is touching the patient, and press shock button.

Follow the machine’s prompts.
If the machine says “No shock indicated”, return to CPR instructions.
If the machine says “Shock patient”, make sure nobody is touching the patient, and press shock button again.

Continue following the machine’s voice prompts until help arrives.
Acute myocardial infarction
Heart attack; specifically, death of the heart muscle from obstruction of its blood flow. The heart receives its blood flow through the coronary arteries.

Airway
Route for the passage of air into and out of the lung. The upper airway, or air passages above the larynx (voice box): including nose, mouth, and throat.

Anaphylaxis
The acute, generalized, severe, allergic reaction with simultaneous involvement of several organ systems, usually cardiovascular, respiratory, skin, and gastrointestinal.

Angina Pectoris
Chest pain from coronary artery disease that is brought on by excitement or exertion and often relieved by rest and nitroglycerin tablet.

Apnea
Having no spontaneous breathing.

Arrhythmia
An irregular or abnormal heart beat.

Asthma
A disease of the lungs in which muscle spasms in the small air passageways and production of a large amount of mucus result in airway obstruction often causes wheezing breath sounds.

Automated external defibrillator (AED)
A portable medical device that performs a computer analysis of the patient’s cardiac rhythm and is capable of delivering a defibrillatory shock when indicated. May be used by trained lay persons as part of a public access defibrillation (PAD) program.

Automated implanted cardiac defibrillator (AICD)
Device that analyzes the electrical activity of the patient's heart and, under the right condition, delivers an electrical charge to restore the heartbeat. This automated implanted cardiac defibrillator is installed inside the patient's heart chamber.

Bradycardia
Slow heart beat.

Bronchitis
The swelling and irritation of the bronchi, the airways that connect the windpipe to the lungs. May be acute (ie: a cold) or chronic (ie: repeated exposure to dust or smoke)

Burn
A lesion caused by heat, chemical or electricity exposure.

Cerebrovascular Accident (CVA), Brain Attack, Stroke
A sudden lessening or loss of consciousness, sensation, and voluntary movement caused by rupture or obstruction of an artery in the brain often showing signs of slurring speech, weakness in arm or leg, facial droop, or lack of movement.

Congestive Heart Failure
A disease in which the heart loses its ability to pump blood, usually as result of damage to the heart muscle often causing fluid build up in the lungs.

COPD (Chronic Obstructive Pulmonary Disease)
A set of breathing-related problems such as: chronic cough, spitting or coughing mucus, breathlessness upon exertion, and progressive reduction in the ability to exhale. The most common form of COPD is a combination of chronic bronchitis and emphysema that causes a loss of lung function.

Defibrillator
A battery-powered device that is used to record cardiac rhythm and to generate and deliver an electric charge to patients. There are two kinds of defibrillator, implanted cardiac defibrillator and external portable defibrillator often called an AED (Automated External Defibrillation).

Diabetes
Metabolic disorder in which the body cannot metabolize glucose, usually due to a lack of insulin.

Diaphoretic / Diaphoresis
Sweaty; Profuse secretion of sweat.

Ectopic Pregnancy
A fetus that is growing outside of the uterus. Most commonly located in the fallopian tube; may cause life threatening internal or vaginal bleeding.
Emphysema
A chronic disease that slowly destroys the air sacs in the lung; most commonly caused by smoking. Patients are routinely prescribed oxygen at home.

Epi-pen
An automatic syringe that injects epinephrine (adrenaline) that may be self-administered and is used primarily to treat anaphylaxis.

Full Term
The usual gestation period for the development of a baby is nine calendar months or 40 weeks. A normal, full term baby will weigh approximately seven pounds at birth. Any baby that delivers before 36 weeks gestation or weighs less than 5.5 pounds at birth is considered preterm.

Glucometer
Medical device used to measure a patient’s blood sugar (glucose) level. Used frequently by diabetic patients.

Hazardous Material (Haz-Mat)
The hazardous materials may be of many different types, including chemicals, radioactive materials, and poisons, in the form of solids, liquid, or gas. The hazardous may be obvious; other times, it is not. Sometimes the dangerous nature of situation is not recognized until many people have been needlessly exposed or injured. This is particularly true in case where odorless poisonous gases or vapor have been released.

Heart Problems
The heart problems are usually referred to heart attack and other forms of heart disease, which include but not limited to acute myocardial infarction, angina pectoris, arrhythmia, bradycardia, tachycardia, congestive heart failure, cardiomyopathy, angioplasty, by-pass surgery, stent placement, pacemaker and AICD.

Hypertension
High blood pressure. In the adult, defined as over 140/90mmHg (systolic over diastolic). In the child it depends on the patient's age.

Hypotension
Low blood pressure. In the adult, defined as under 90mmHg systolic.

Labor
The process by which the muscles of the uterus open the birth canal and push the baby down and through so that it can be born.

 Miscarriage (abortion)
Delivery of the fetus before 20 weeks gestation, for any reason.

Murmur:
Cardiac murmurs result from vibrations set up in the bloodstream and the surrounding heart and great vessels as a result of turbulent blood flow. The murmur can be heard by putting stethoscope over the chest wall

Pacemaker
A device, usually implanted underneath the skin of the chest, that gives off regular electrical impulses that regulate the heart rate.

Placenta Previa
The placenta is located over or very near the internal opening of the birth canal.

Preterm (Also see Full term)
A baby who delivers before 36 weeks gestation or who weights less than 5.5 pounds at birth.

Prolong Seizure (Also see Seizure)
A single seizure lasting longer then ten minutes or repeated seizure closely followed one another (status epilepticus) with no return of full consciousness between them.

Rectum
The lowermost end of the large intestine.

Seizure
In general, most people take the term "seizure" to mean generalized, uncoordinated muscular activity usually with loss of consciousness. However, seizures occur in a variety of forms from a severe convulsion to simply "blacking out" for a few seconds. Many seizures are followed by a postictal state of sleeping or unconsciousness that last for a varying length of time.

Stoma
An artificial permanent opening made by a surgical procedure most commonly in the abdominal wall or neck.

Syncope / Syncopal episode
Fainting; Loss of consciousness resulting from insufficient blood flow to the brain.

Tracheostomy
A surgical opening in the neck that allows direct access to the trachea (windpipe) through which a patient can breath.
Tachycardia
Rapid heart beat.

Toxemia of Pregnancy
Toxemia of pregnancy is defined as the onset of hypertension, leg edema, and protein in urine after the 20th week of pregnancy. Pre-eclampsia is toxemia without the presence of seizures. If seizures occur in a toxemic patient without other apparent cause, the condition is then termed eclampsia. Toxemia occurs most commonly in young first time pregnant and older women after many pregnancies. The syndrome usually disappears after delivery.

Ventilator
A mechanical device that moves air into and out of the lungs. Often portable and battery operated.

Vomiting
Disgorging the contents of the stomach through the mouth.

Vomitus
Vomited material.

Wheeze
A high-pitched, whistling breath sound characteristically heard on expiration in patients with asthma.

Other Guidelines
1. Heart murmur and high blood pressure (hypertension) are not considered a “heart problem”
2. Infant: 0-1 years
3. Child: 2-7 years
4. Adult 8 years or older
TIME AND INTERVAL DEFINITIONS
[All time collection elements are HHMM.SS without a colon in the field]

1. **Date Incident Reported** - The date the call is first received by the dispatch center. The recommended date format is YYYYMMDD to permit sorting across multiple years. This format is also recommended for data export purposes.

2. **Time Incident Reported** - The time the call is first received by the dispatch center. This provides the start point of the EMS response.

3. **Time Dispatch Notified** - Time of the first connection with EMS dispatch. This provides the start point of the dispatch component of the EMS response.

4. **Time Unit Notified** - The time the response unit is notified by EMS dispatch. This permits measurement of the actual responder response or delays.

5. **Time Unit Responding** - The time that the response unit begins physical motion. This permits measurement of the delay between notification of EMS responder and the actual mobilization of the response unit.

6. **Time of Arrival at Scene** - The time the unit stops physical motion at scene (last place that the unit or vehicle stops prior to assessing the patient). This permits measurement of the time required for the response vehicle to go from the station to the scene.

7. **Time of Arrival at Patient** - The time response personnel establish direct contact with the patient. In certain situations there may be a significant delay between the time at which a response unit arrives at the scene and the time at which the personnel can access the patient.

8. **Time Unit Left Scene** - The time when the response unit began physical motion from the scene. This permits the calculation of scene time by subtracting the time of arrival at scene from the time unit left scene.

9. **Time of Arrival at Destination** - The time when the patient arrives at the receiving hospital. This permits the calculation of the time required to go from the scene to the receiving hospital.

10. **Time Back in Service** - The time the response unit is back in service and available for another response. This allows for planning of EMS resources, by assessing the delay between arrival at the receiving hospital and availability of the response unit.

11. **Time Back in Quarters** - Not a Uniform Data Set element, but may be kept by the departments. The time the response unit stops physical motion after returning to the station.

12. **Response Time** - Not a Uniform Data Set element, but is kept by all departments within the Milwaukee County EMS system. This is measured by calculating the difference between the **Time Incident Reported** and the **Time of Arrival at Scene**.

**RESPONSE DEFINITIONS (minimum)**
[Send the next highest response if any inconsistency or confusion with the caller’s information]

**PRI**: EMT-B with or without AED or advanced skills. Response time 12 minutes 59 seconds or less, 90% of time.

**BLS**: EMT-B with AED and advanced skills. Response time 4 minutes 59 seconds or less, 90% of time.

**MED**: EMT-P with simultaneous, closest BLS unit. Response time 9 minutes 59 seconds or less, 90% of the time.
